

Data & Launch Plan v1

Event taxonomy · Dashboards · Fraud signals · Beta → soft launch → public · Store submission

PART 1 — DATA & ANALYTICS

Kyun yeh Phase 0 hai

Event schema baad mein badalna painful hai — purana data naye schema mein fit nahi hota aur aap 6 mahine ka history kho dete ho.

Event taxonomy launch se pehle lock karo, chahe dashboards baad mein banein.

1. Event taxonomy

Naming convention: `object_action` — lowercase, underscore, past tense.

Category	Events
Session	<code>app_opened</code> , <code>app_backgrounded</code> , <code>session_ended</code>
Auth	<code>signup_started</code> , <code>otp_sent</code> , <code>otp_verified</code> , <code>signup_completed</code> , <code>login_completed</code>
Discovery	<code>feed_viewed</code> , <code>room_card_impressed</code> , <code>room_card_tapped</code> , <code>search_performed</code> , <code>category_selected</code>
Room	<code>room_joined</code> , <code>room_left</code> , <code>room_watch_heartbeat</code> (30 sec), <code>mic_requested</code> , <code>mic_granted</code>
Engagement	<code>message_sent</code> , <code>emoji_sent</code> , <code>host_followed</code> , <code>host_unfollowed</code> , <code>stream_shared</code>
Economy	<code>coin_pack_viewed</code> , <code>purchase_initiated</code> , <code>purchase_completed</code> , <code>purchase_failed</code> , <code>gift_sent</code> , <code>cosmetic_purchased</code> , <code>bonus_coins_earned</code>
Host	<code>go_live_started</code> , <code>go_live_ended</code> , <code>stream_heartbeat</code> , <code>withdrawal_requested</code> , <code>withdrawal_completed</code>
Safety	<code>user_reported</code> , <code>user_blocked</code> , <code>content_flagged</code> , <code>moderation_action_taken</code>
Lifecycle	<code>push_received</code> , <code>push_opened</code> , <code>notification_permission_granted</code>

2. Event structure

json

```
{
  "event": "gift_sent",
  "user_id": 1042871,
  "session_id": "uuid",
  "timestamp": "2026-08-11T20:14:03Z",
  "device_id": "hashed",
  "app_version": "1.2.0",
  "platform": "android",
  "country": "IN",
  "locale": "hi-IN",
  "user_level": 14,
  "is_paying": true,
  "properties": {
    "gift_id": "yacht_01",
    "coin_amount": 19500,
    "coin_type": "paid",
    "room_id": 88213,
    "host_id": 55102,
    "combo_count": 1
  }
}
```

Rule: common properties SDK level par automatically attach hon — developer manually na bheje. Warna 20% events mein miss ho jaayenge.

3. Pipeline

```
App / Server → Kafka → ClickHouse (analytics)
                  → Postgres (transactional, already there)
                  → S3 (raw archive, replay ke liye)
```

S3 raw archive zaroori hai — schema badalne par ya bug milne par replay kar paoge.

Launch stack: Kafka + ClickHouse + Metabase. Amplitude/Mixpanel is volume par mehngi padti hain.

4. Dashboards

Daily — founder dashboard (subah 10 min)

Metric	Kyun
DAU, new users	Growth
Gross recharge (₹)	Revenue
Payout ratio	Sabse important health metric
Channel mix (IAP / web / reseller)	Margin
Cosmetics share of coin spend	Margin lever
Active hosts, total live hours	Supply
Concurrent peak	Infra planning
Moderation actions	Safety

Weekly — cohort dashboard

- D1 / D7 / D30 retention by signup week
- Paying conversion by cohort
- Host D7 / D30 retention
- Revenue by segment (whale / regular / casual)
- CAC by channel

Monthly — business dashboard

- Gross margin breakdown
 - Coin float liability
 - Agency performance ranking
 - LTV by cohort
 - Unit economics vs plan
-

5. Fraud & risk — alerts, dashboards nahi

Signal	Threshold
Circular gifting between two accounts	> 3 exchanges in 24 hrs
New account big recharge	> ₹10,000 in first 48 hrs
Gift concentration	Host ke 80%+ gifts ek user se
Rapid withdraw pattern	Recharge → gift → withdraw within 24 hrs
Device sharing	Same device ID, 5+ accounts
Viewer/chat ratio anomaly	500 viewers, < 10 messages

6. A/B testing

Launch par zaroorat nahi, framework Phase 1 mein chahiye.

Pehle teen tests:

1. Coin pack pricing — bonus percentages
2. First-gift prompt timing — join ke 30 sec vs 2 min
3. Push notification copy — host name vs generic

Requirements: consistent bucketing (user_id hash) · minimum sample size calculator · **ek time par sirf ek economy test** (warna results confounded ho jaayenge)

PART 2 — LAUNCH PLAN

Phase A — Closed beta (4 weeks)

Scope: 30-50 invited hosts, ~500 invited users. TestFlight + Play internal testing.

Week	Focus
1	Core flow — signup, room join, chat. Crash hunt
2	Economy live — real recharges (chhote amounts), gifting, ledger verification
3	Payout cycle — pehla real payout batch, reconciliation test
4	Moderation drill — deliberately violate, detection aur response check karo

Exit criteria:

- Crash-free rate > 99%
- Ledger zero mismatches, 7 consecutive days
- Pehla payout batch successfully reconciled
- L1 detection < 30 sec verified
- D7 retention > 20% (invited users hain, isliye high hoga)

Phase B — Soft launch (6 weeks)

Scope: Public on Play Store, ek region/language pe focused. **iOS baad mein.**

Kyun Android pehle: is category mein India ka market Android hai (Vone ke Play par 23,000+ ratings vs iOS par 382), aur Apple ka review process is category ke liye zyada strict hai.

Week	Focus
1-2	Organic + host referrals only. Koi paid ads nahi
3-4	First agencies onboard
5-6	Metrics stabilize, tuning

Closely watch: payout ratio · cosmetics share · moderation load per 1,000 hours · crash rate on low-end devices

Phase C — Public launch

Tabhi jab soft launch gates cross hon. Phir iOS, phir paid ads.

Store submission

Google Play

- Content rating questionnaire mein **honest raho** — "Users Interact", "Shares Location", "In-App Purchases" sab declare karo
- Data safety form: sab collected data types list karo
- Age rating **18+**
- Privacy policy live URL par ho, submission se pehle
- **UGC policy ke liye moderation description ready rakho** — reviewer poochta hai

Apple

Guideline 1.2 (UGC) ke liye chaar cheezein demonstrate karni hongi:

1. Content filtering method

2. Reporting mechanism
 3. Blocking ability
 4. Published contact info
- **Demo account do jisme content already ho** — khaali app reject ho jaata hai
 - Review notes mein moderation setup explain karo
-

Pre-launch checklist

- ☐ Privacy policy + ToS + Community Guidelines live
 - ☐ Grievance Officer contact published — in-app aur website
 - ☐ Kill switch tested — gifting, payouts, streaming alag-alag band ho sakein
 - ☐ Force-update mechanism tested
 - ☐ Rollback plan documented
 - ☐ Support email + response process
 - ☐ Crash monitoring + alerting
 - ☐ On-call rotation documented (shuru mein aap hi ho, par likha ho)
 - ☐ Ledger reconciliation running daily
 - ☐ Moderation team trained aur rostered
-

First 30 days — war room

Day	Kya
1-3	Har 4 ghante metrics check — crash, payment failure, room join failure
4-7	Pehla payout batch. Manually verify har transaction
8-14	Host feedback calls — 20 hosts se baat karo
15-21	Economy tuning — gift tier gap dekho
22-30	Retention analysis, first cohort ka D30

Daily standup ke teen sawaal:

1. Kya toota?
2. Kya paisa leak hua?
3. Kya safety incident hua?
